

ABSTRACT

Night reflective fringe for clothing, pet accessories and vehicles comprising a multitude of fringe-like strips of which at least one surface has retro-reflective properties for the purpose of providing both an aesthetically pleasing daytime and nighttime appearance as well as enhanced visibility at night to protect the wearer or vehicle. The invention increases the likelihood of both use and visibility by incorporating night reflective properties into established designs in which fringe is used, thereby increasing the number of different angles available for gathering incidental light rays and reflecting same back to the light source.
